Purpose of a Poster

To communicate/publicize to others your:

- research/experiment results
- study reports
- project outcomes
- organization features
- business plans

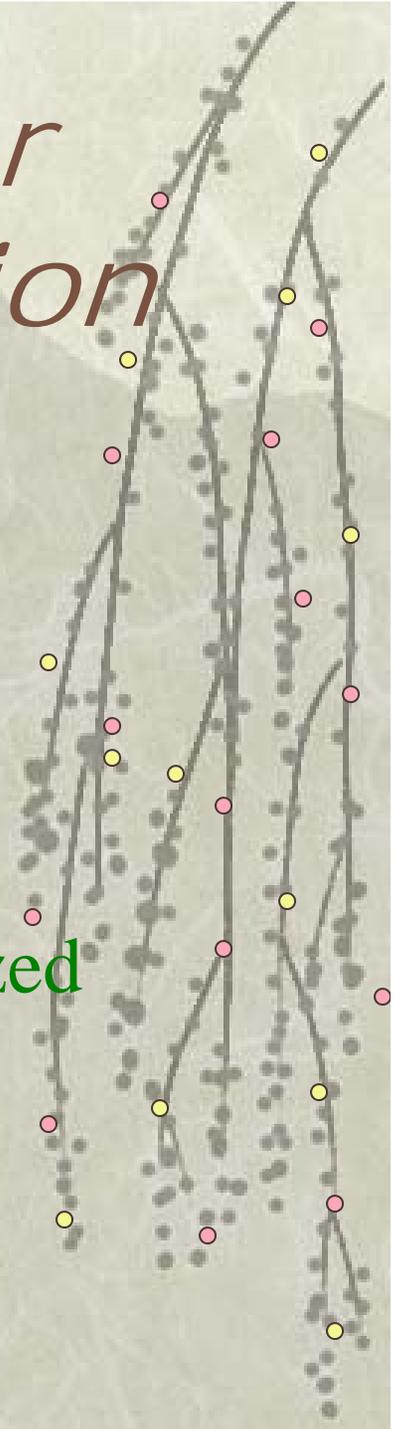

in a way that is:

- clear
- effective

Effective and Clear Visual Communication

- Is able to catch as many viewers' attention as possible
- Is pleasing to the eye
- Is able to capture viewers' interest in less than 15 secs
- Is readable, succinct, and well organized
- Is informative
- Is legible from 3-6 feet
- Is a conversation starter

Types of Posters

Horizontal and vertical and panels

Multiple vertical panels

Using a Windbreak Habitat Model Across Broad Landscapes: The Effect of Local Landscape Composition and Geographic Location

George Hess¹, John Poulsen², Raymond O'Connor², Jeff Bay³

1. Windbreaks as Habitat

Agriurban areas — fields, pastures, and orchards — are important production land for wildlife. In the U.S., Great Plains farmlands are important habitats for many species. Windbreaks have been shown to affect birds, insects, mammals, and farmsteads from the surrounding fields. Windbreaks provide cover for the winter months before the birds and other wildlife return to their native habitats. Windbreaks can also provide cover for the winter months before the birds and other wildlife return to their native habitats.

2. Regional Evaluation of Windbreaks

The Environmental Monitoring and Assessment Program (EMAP) Land Use Group is charged with assessing the ecological value of U.S. agricultural land — including a pilot study to evaluate the habitat value of windbreaks on a regional scale. The goal is to use a bird species richness index to measure the habitat value of windbreaks in Nebraska.

3. Bird Species Richness Index

We used the U.S. Fish and Wildlife Service's Bird Species Richness Index (BSRI) which estimates the number of breeding bird species in a single watershed and is supported by four variables: diversity, abundance, and richness. The index is calculated as follows: $BSRI = \frac{1}{n} \sum_{i=1}^n \frac{1}{p_i}$ where n is the number of species and p_i is the proportion of individuals in each species. The index is calculated as follows: $BSRI = \frac{1}{n} \sum_{i=1}^n \frac{1}{p_i}$ where n is the number of species and p_i is the proportion of individuals in each species.

4. Validating BSRI Model

In 2005, a team of five ornithologists visited 15 of the 100 windbreaks in Eastern Nebraska to collect data for the BSRI model. The model was validated using the data collected during the field visits. The model was validated using the data collected during the field visits.

5. Results of Validation

The model's estimates of the number of bird species in the Nebraska windbreaks (range 10-25) were compared to the number of species observed in the field. The model's estimates of the number of bird species in the Nebraska windbreaks (range 10-25) were compared to the number of species observed in the field.

6. Failure of the Model

The model's estimates of the number of bird species in the Nebraska windbreaks (range 10-25) were compared to the number of species observed in the field. The model's estimates of the number of bird species in the Nebraska windbreaks (range 10-25) were compared to the number of species observed in the field.

7. Local Landscape-Scale Effects

The model's estimates of the number of bird species in the Nebraska windbreaks (range 10-25) were compared to the number of species observed in the field. The model's estimates of the number of bird species in the Nebraska windbreaks (range 10-25) were compared to the number of species observed in the field.

8. Conclusions

The model's estimates of the number of bird species in the Nebraska windbreaks (range 10-25) were compared to the number of species observed in the field. The model's estimates of the number of bird species in the Nebraska windbreaks (range 10-25) were compared to the number of species observed in the field.

EFFECT OF HEMODIALYSIS ON HEMOSTATIC PLATELET FUNCTION IN UREMIC PATIENTS

Sharad C. Mathur, M.D.¹, Jonathan L. Miller, M.D., Ph.D.¹, Sriram S. Narsipur, M.D.²
 Departments of Pathology¹ and Medicine², SUNY Upstate Medical University, Syracuse, NY

Introduction

Anemia and platelet dysfunction are major contributors to the hemorrhagic diathesis seen in patients with end-stage renal disease (ESRD). Following hemodialysis, there is frequently a clinical improvement in bleeding. However, such clinical improvement is not typically accompanied by any consistent change using standard clotting assays. Evaluation of platelet function has shown a decrease in platelet membrane glycoprotein (GP) IIb/IIIa and a functional improvement in GPIIb/IIIa following hemodialysis. Currently used laboratory tests separate the elements of primary hemostasis (platelet response) from secondary hemostasis (coagulation cascade) and therefore are not sensitive to the effect of platelet procoagulant activity and platelet microparticle formation. We evaluated the effect of hemodialysis on coagulation using a new laboratory instrument, the Clot Signature Analyzer (CSA) (Kylun Corporation, Scarsdale, NY).

Methods

Blood was collected before and immediately following hemodialysis in two patients with ESRD. Platelet GPIIb/IIIa function was analyzed by platelet aggregation in response to incremental concentrations of ristocetin. Hemostatic function was further evaluated by the CSA instrument. This instrument uses a constant flow system to determine the time to platelet plug formation and platelet-dependent fibrin clot formation for non-anticoagulated whole blood. Whole blood flows through a tube that is punctured by a needle to cause a sudden increase in shear stress and activation of hemostatic pathways (Figure 1). Because it uses non-anticoagulated whole blood, this system is sensitive to platelet procoagulant function and platelet microparticle formation. Statistical significance was assessed using a two-tailed student's t-test for paired data. Differences in pre-dialysis and post-dialysis values were considered significant at p < 0.05.

 The Clot Signature Analyzer (CSA) uses a constant flow system to determine the time to platelet plug formation and platelet-dependent fibrin clot formation for non-anticoagulated whole blood. Whole blood flows through a tube that is punctured by a needle to cause a sudden increase in shear stress and activation of hemostatic pathways (Figure 1). Because it uses non-anticoagulated whole blood, this system is sensitive to platelet procoagulant function and platelet microparticle formation. Statistical significance was assessed using a two-tailed student's t-test for paired data. Differences in pre-dialysis and post-dialysis values were considered significant at p < 0.05.

Results

Fig. 2
 Levels of factor VII and von Willebrand factor are reported with a color scale following hemodialysis. The red color indicates the highest value.

GPIIb/IIIa activity following hemodialysis was consistently decreased, as shown by diminished aggregation in response to incremental concentrations of ristocetin (Figure 3). The EC50 for ristocetin following hemodialysis was 0.83 mg/ml, a statistically significant increase of 0.07 mg/ml over the pre-dialysis value (p<0.01) (Figure 4).

Fig. 3
 The time to platelet-dependent fibrin clot formation was significantly prolonged in 7 patients, and platelet-dependent fibrin clot formation was abnormally prolonged in 6 patients, and platelet-dependent fibrin clot formation was abnormally prolonged in 6 patients, and platelet-dependent fibrin clot formation was abnormally prolonged in 6 patients, and platelet-dependent fibrin clot formation was abnormally prolonged in 6 patients.

Baseline CSA platelet plug formation was abnormally prolonged in 6 patients, and platelet-dependent fibrin clot formation was abnormally prolonged in 7 patients. In 8 patients, a clot had still not formed after the 50 minute observation period. Following dialysis, the time to platelet-dependent clot formation was shortened for 6 of the 6 patients for whom data could be analyzed (Figure 5).

Platelet microparticle formation was evaluated using flow cytometry in two patients. In response to 4 µM calcium ionophore A23187, there was a dramatic increase in platelet microparticles following hemodialysis (Figure 6).

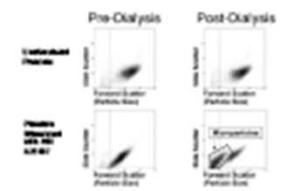

Fig. 6

Discussion

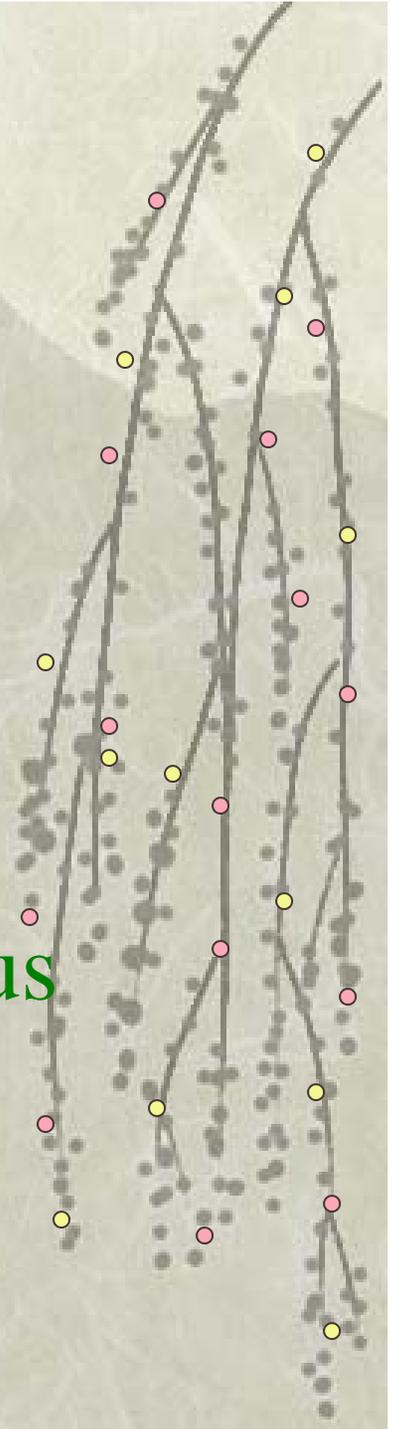

The bleeding diathesis of ESRD and the effect of hemodialysis on it are incompletely understood. Traditional measures of platelet function show a decrease in platelet GPIIb/IIIa function following hemodialysis. Current laboratory tests are limited by the fact that they separate primary hemostasis from secondary hemostasis and therefore do not evaluate the role played by platelets in the coagulation cascade through their procoagulant activity and microparticle formation. The CSA instrument shows a strong trend toward shortening of the time to platelet-dependent fibrin clot formation for whole blood. This assay is sensitive to defects in platelet procoagulant function and platelet microparticle formation. Improvement in these parameters is, therefore, a possible mechanism by which hemodialysis produces an improvement in the bleeding diathesis of ESRD. Preliminary data on platelet microparticle formation from two patients supports this hypothesis. Studies are ongoing to assess platelet procoagulant function following hemodialysis.

Conclusions

- Shear-dependent platelet plug formation is defective in ESRD patients.
- Hemodialysis results in decreased GPIIb/IIIa function manifested by decreased GPIIb/IIIa mediated platelet aggregation in response to ristocetin even in the presence of increased von Willebrand factor levels.
- Platelet-dependent fibrin clot formation is defective in ESRD patients despite normal screening studies of secondary hemostasis (prothrombin time, partial thromboplastin time).
- Platelet-dependent fibrin clot formation is improved by hemodialysis, which may be related to improvement in platelet procoagulant activity or platelet microparticle formation.

Before starting

- Know the intended audience
- Decide what the main message is
- List text, diagrams, tables, photos, etc. to be included
- Budget the space needs for various elements
- Sketch a layout

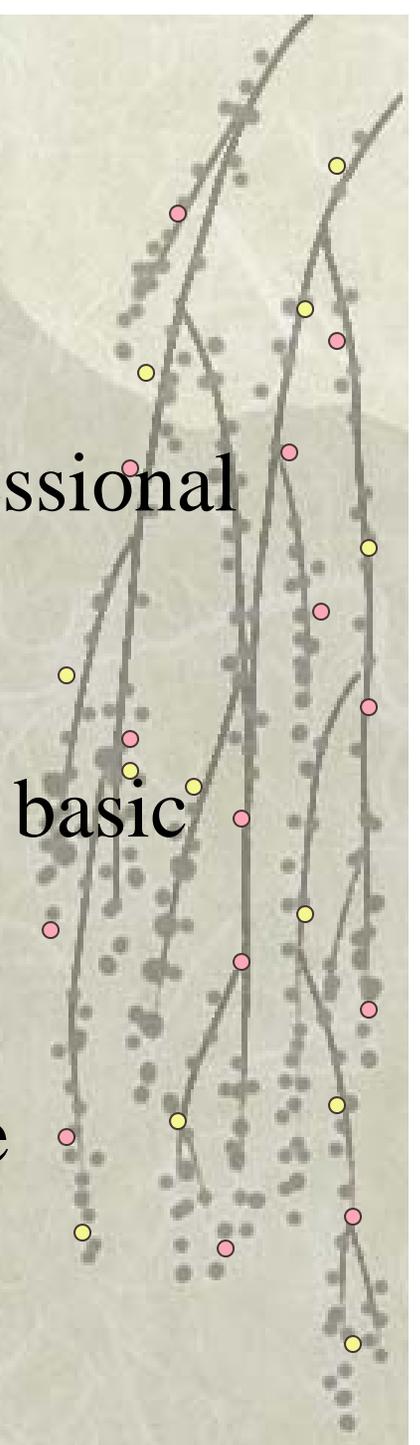

Who is the audience?

- **People in your specialty**
(may use jargon and other shortcuts)
- **People in related fields**
(minimize jargon but may assume knowledge)
- **People in unrelated fields**
(assume no prior knowledge; use the most basic terms)

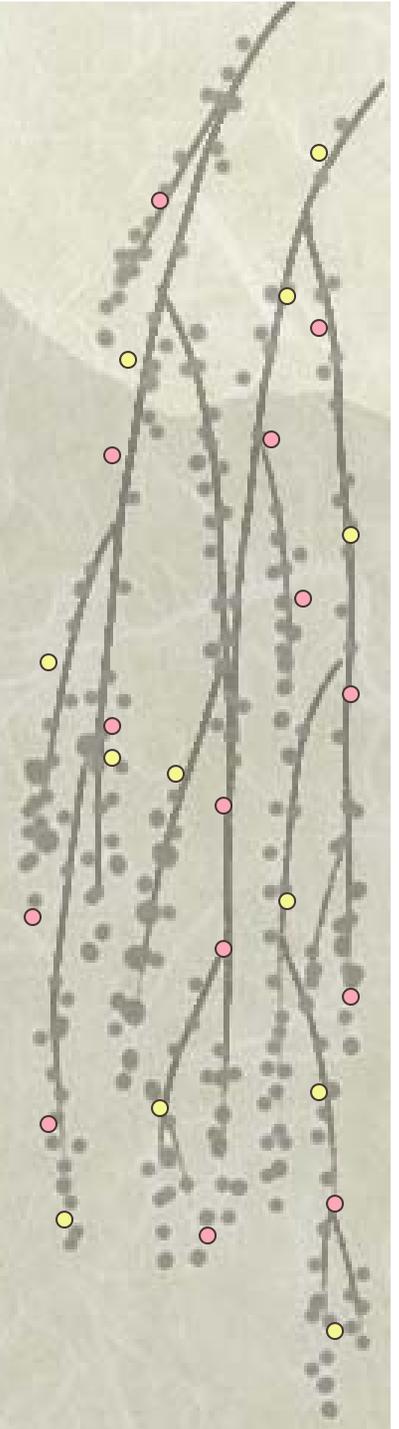

professional

basic

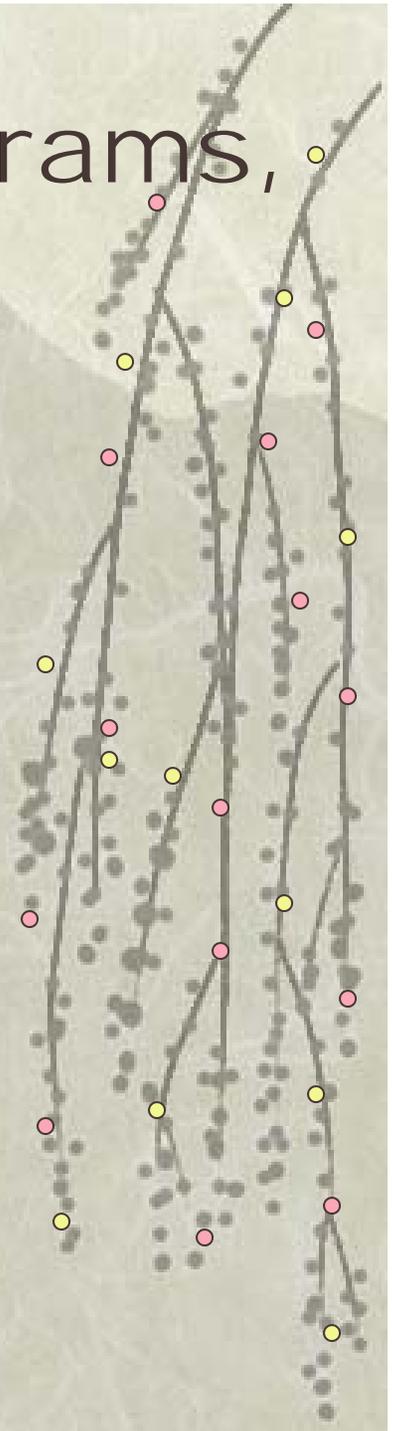

What is the message?

- **State the main point(s) and conclusion(s) succinctly**
(a catchy but descriptive title, an effective abstract or introduction)
- **Focus everything else on those points and conclusions**
(do not try to include everything in a poster)

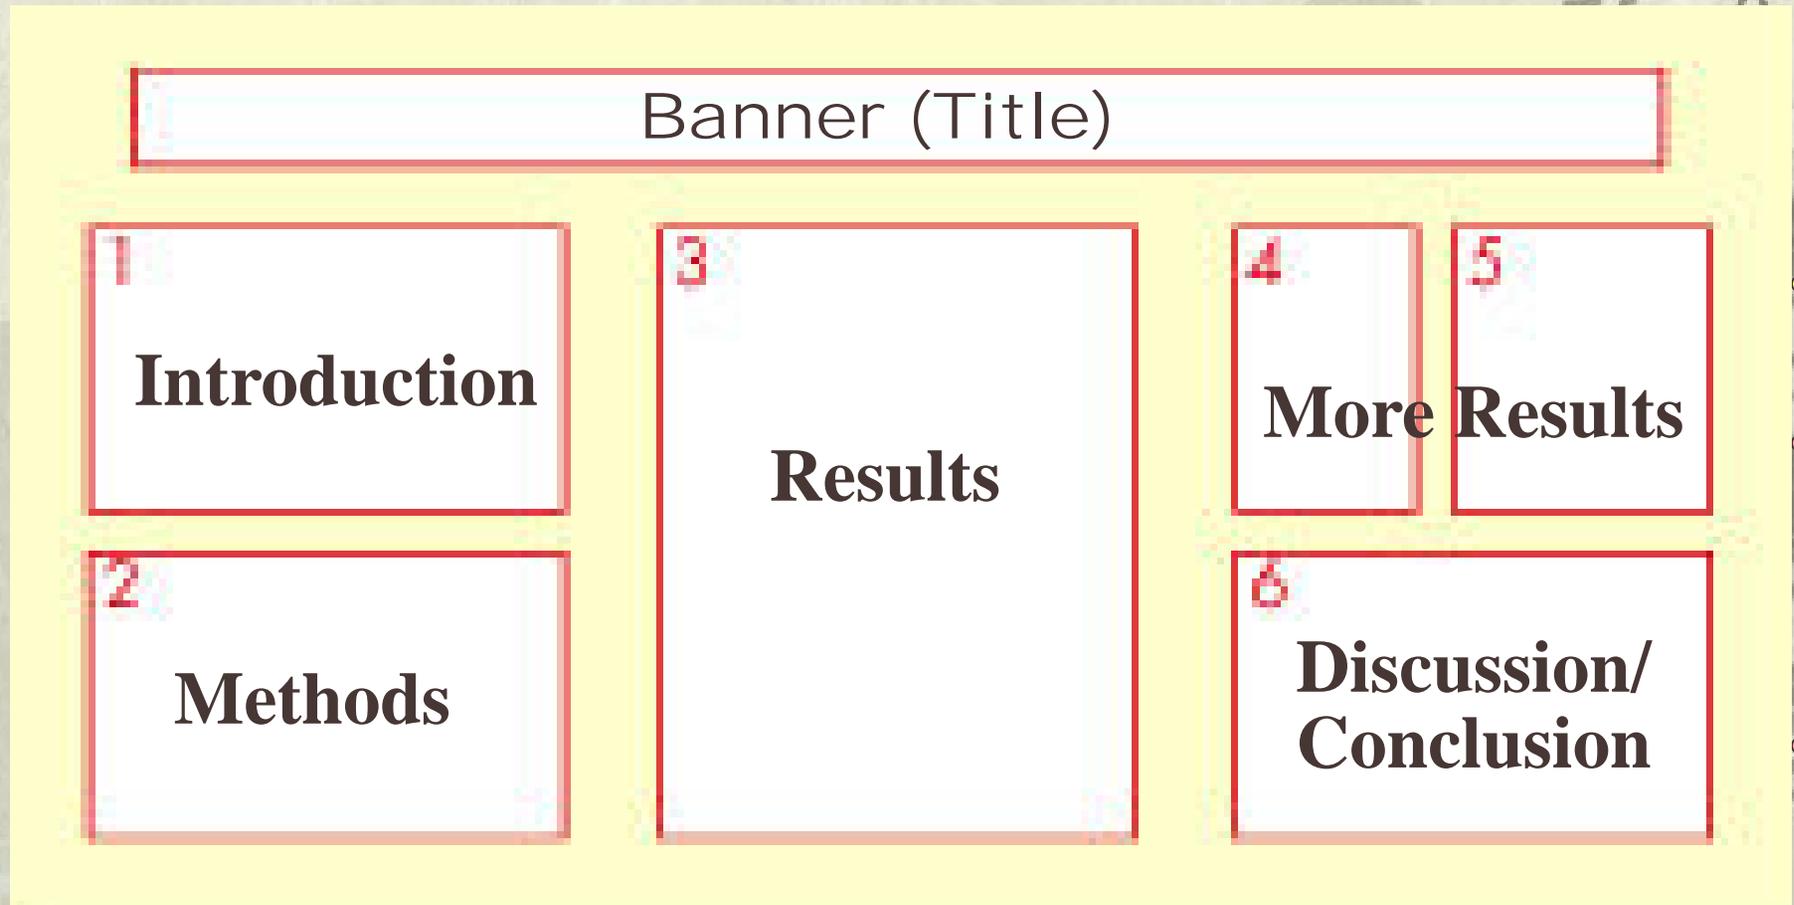

Should you use text, diagrams, tables or photos?

- Utilize all but be strategic and space-conscious.
- Follow: “A picture is worth ten thousand words”
- Tables are more effective than text, figures are better than tables.
- Use short sentences
- Check spelling and grammar
- Include titles and legends

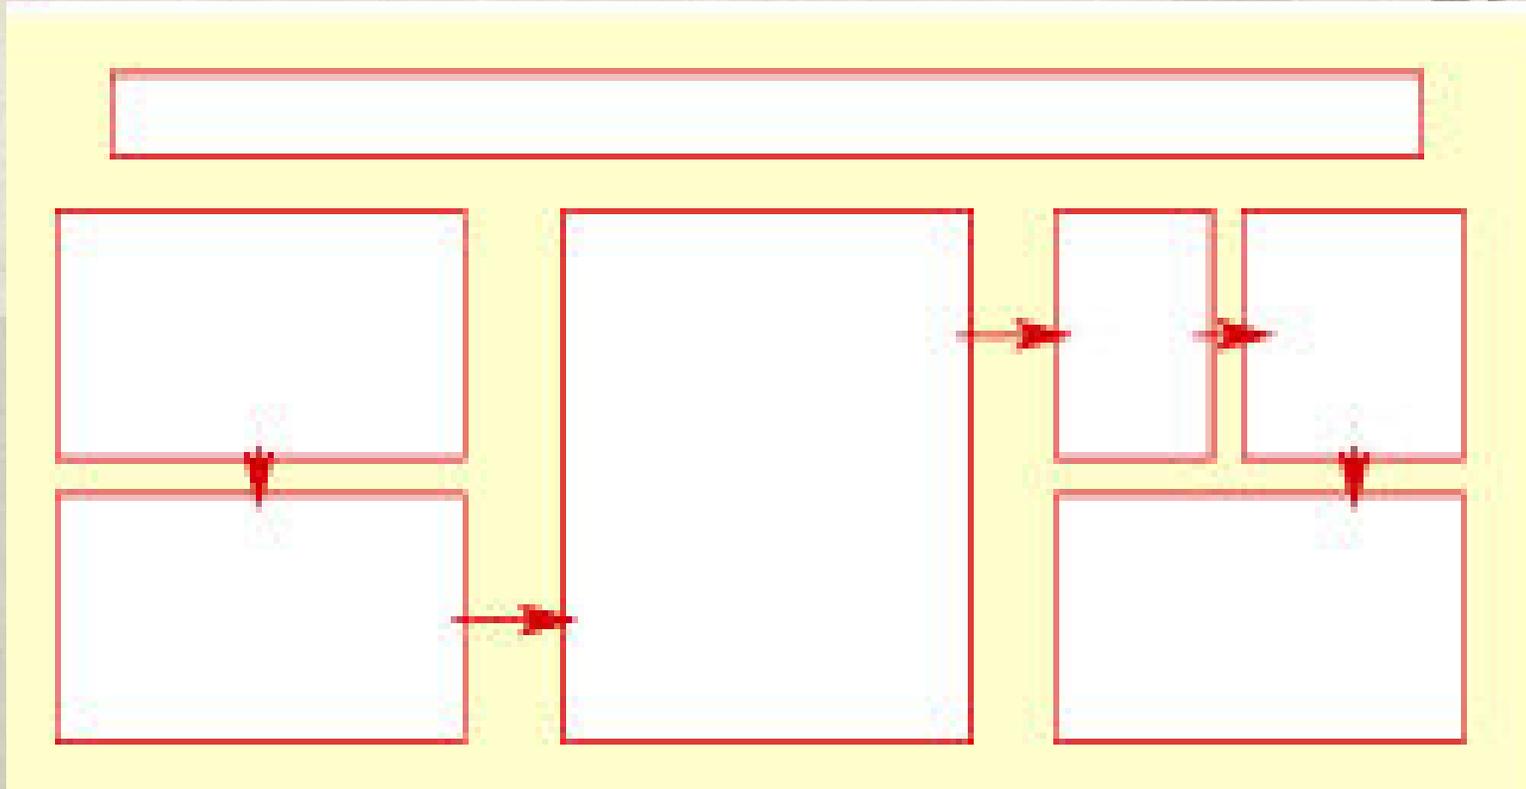

Three Panel Poster Layout

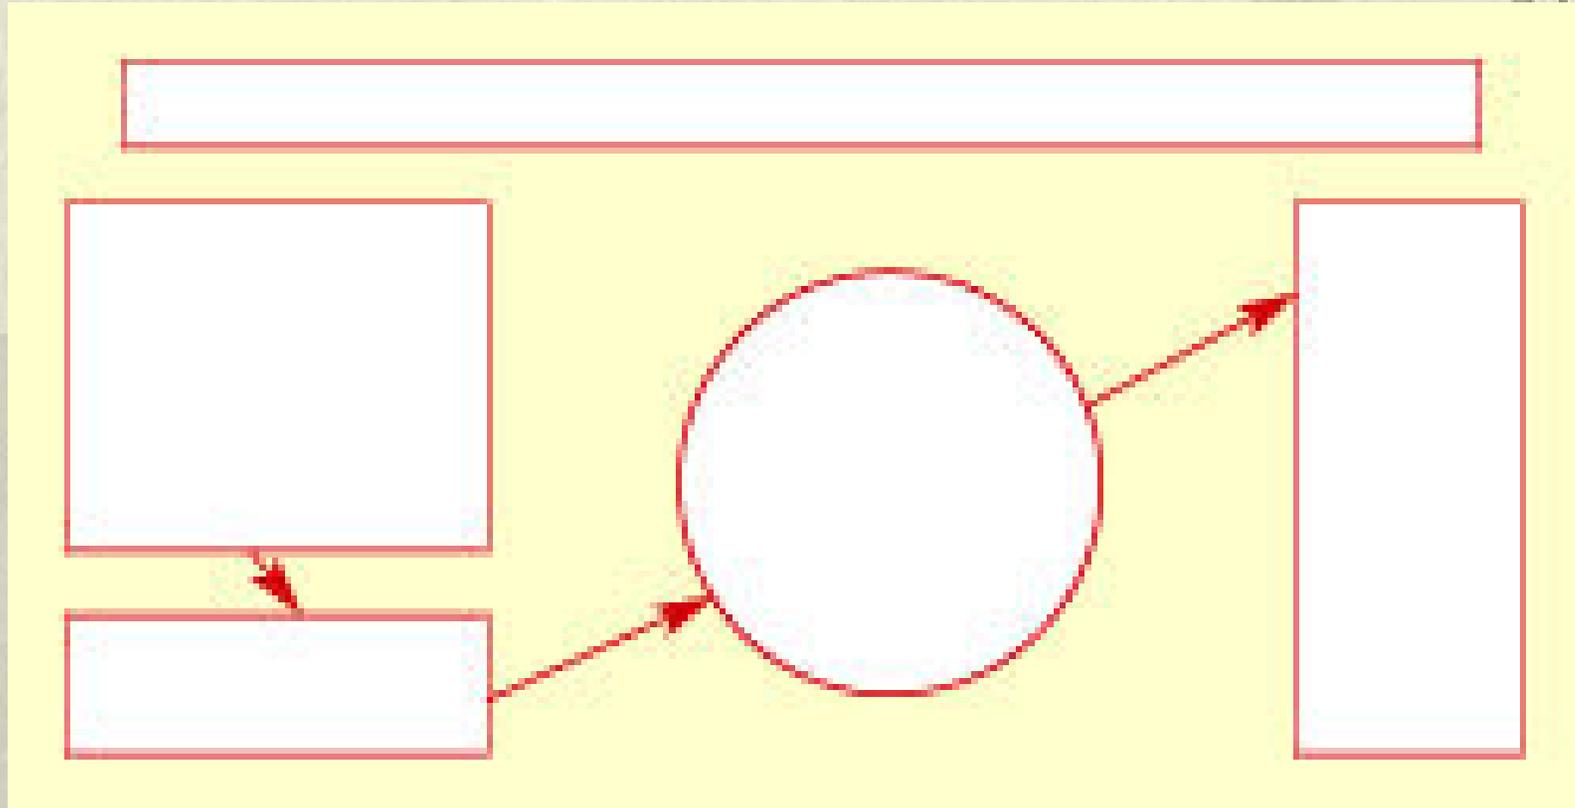

Numbering the panels to guide readers with the flow

Three Panel Poster Layout

Use of arrows instead of numbers

Three Panel Poster Layout

Use of elements of different sizes, shapes, and proportions.

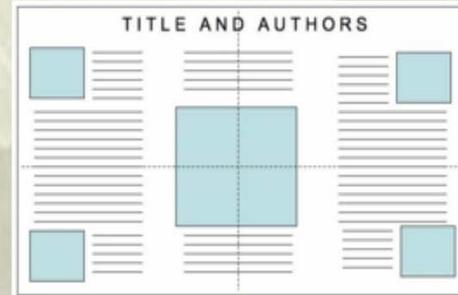

Poster Templates, Pictures and Graphics

Balance and White Space

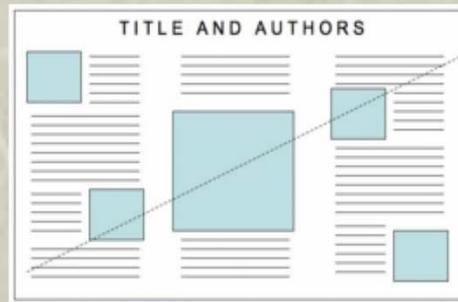

Your poster should have a good visual balance of figures and text, separated by white space. Balance occurs when images and text are reflected (at least approximately) across a central horizontal, vertical, or diagonal axis of symmetry.

Horizontal Symmetry

Horizontal & Vertical Symmetry

Diagonal Symmetry

Asymmetry
(text-heavy on left, image-heavy on right)

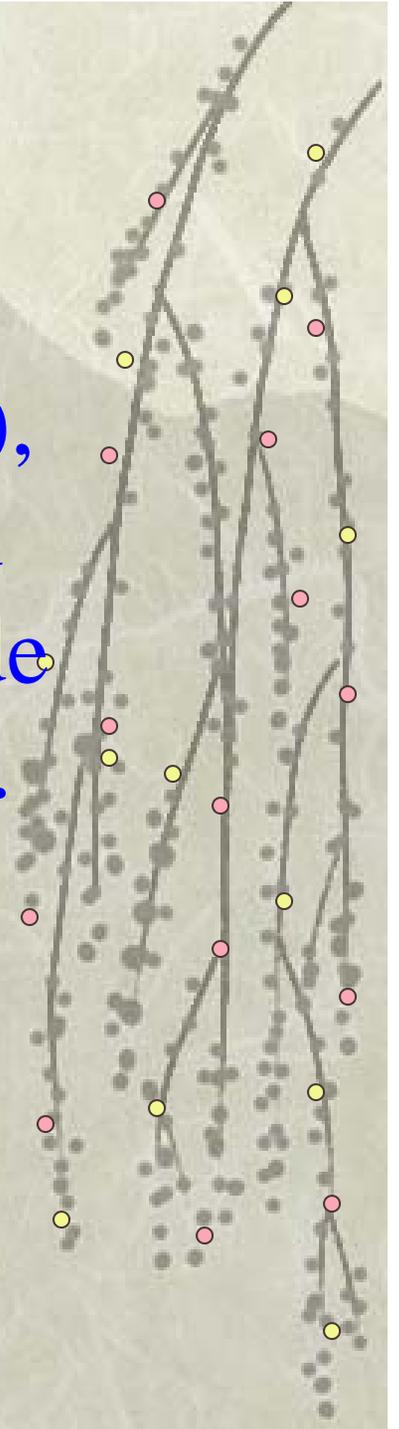

Text Blocks

Keep text blocks to below 50 words.

Banner (Title box)

- A banner shows the title, author (s), and affiliation. The banners should be 10–12 inches tall and 4 feet wide with 1-inch margins on all sides.
- The title should be concise and depict the project. It should be legible at 20 feet.

Abstract

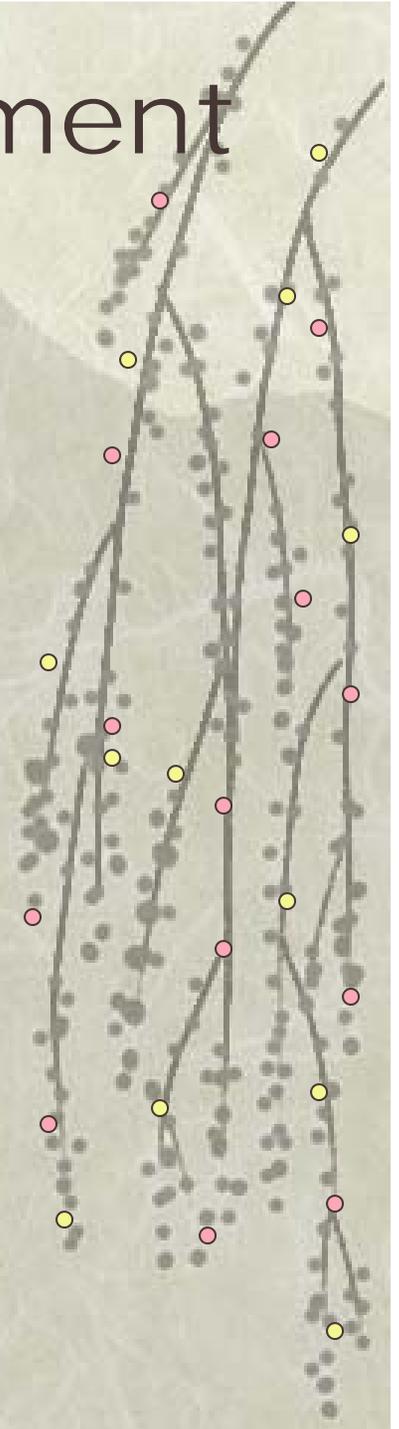

- Optional on a poster depending on the desire of the author or the requirements of the organization.
- It must accurately summarize the
 - hypothesis or research question
 - methods and data
 - conclusions described in the other sections of the poster.

Introduction

- The introduction should address the question:
 - Why did you start this project?
 - It defines the topic and explains the rationale and importance of your study.
- It includes your research question(s) and/ or the hypotheses you tested.
- Significance and originality of the work should be clear.

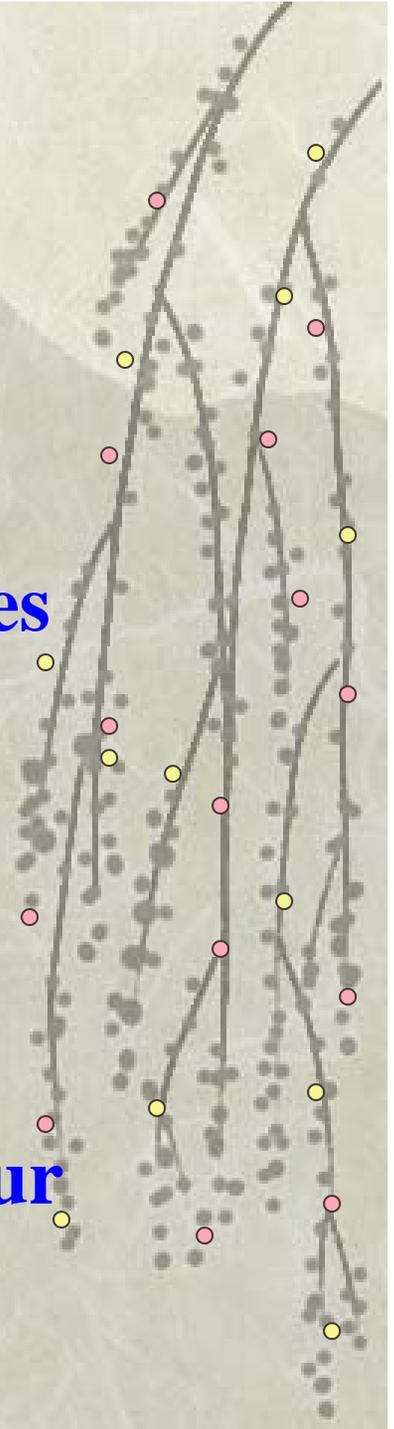

Methods, materials, equipment

- Explain what you did. Ideally, this section gives enough information to allow another researcher to replicate the study.
- Provide enough detail to allow another researcher to judge if the study design was adequate (and thus to judge the validity of your study).
- Flow diagrams work well instead of written text. List major materials and equipment used.

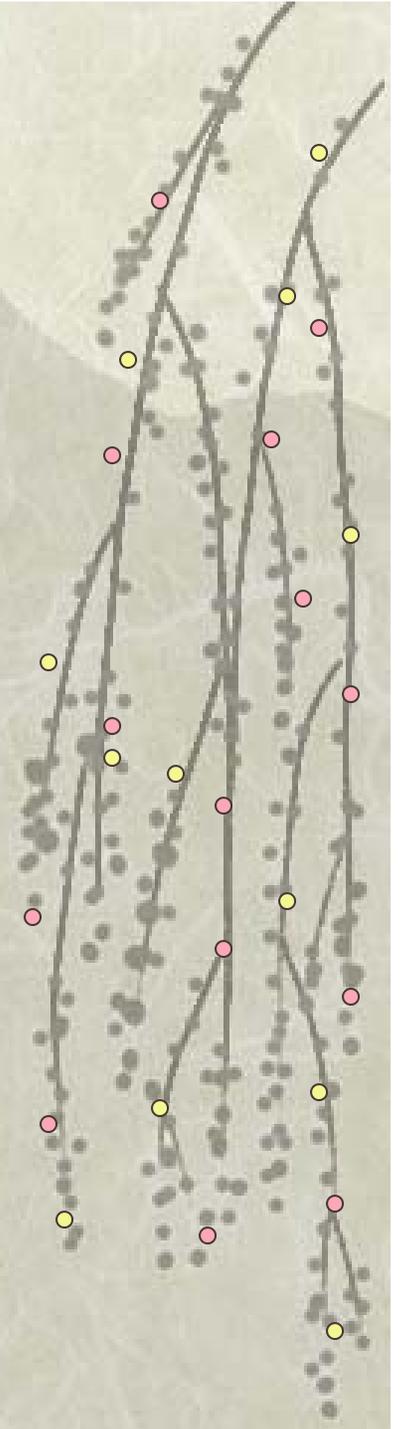

Results

- **This section presents what you have found in your research or the outcome of your project.**
- **It may include statistical analyses, tables and/or figures showing your data.**
- **Arrange your results in a logical order according to the point(s) you want to get across.**
- **Present only enough data to support your conclusions.**

Discussion/Conclusion

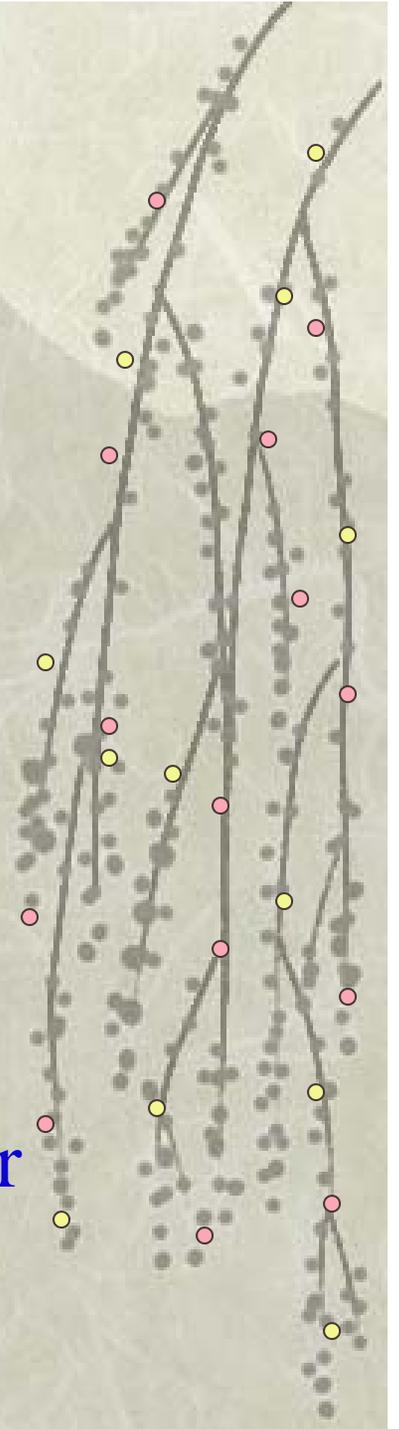

- **What do your results mean?**
- **Present supporting evidence from published reports.**
- **Any contradictory findings should be addressed, and any limitations of your study.**
- **The conclusion section should directly relate to the research question and hypotheses and supported by the results.**

General suggestions

Layout

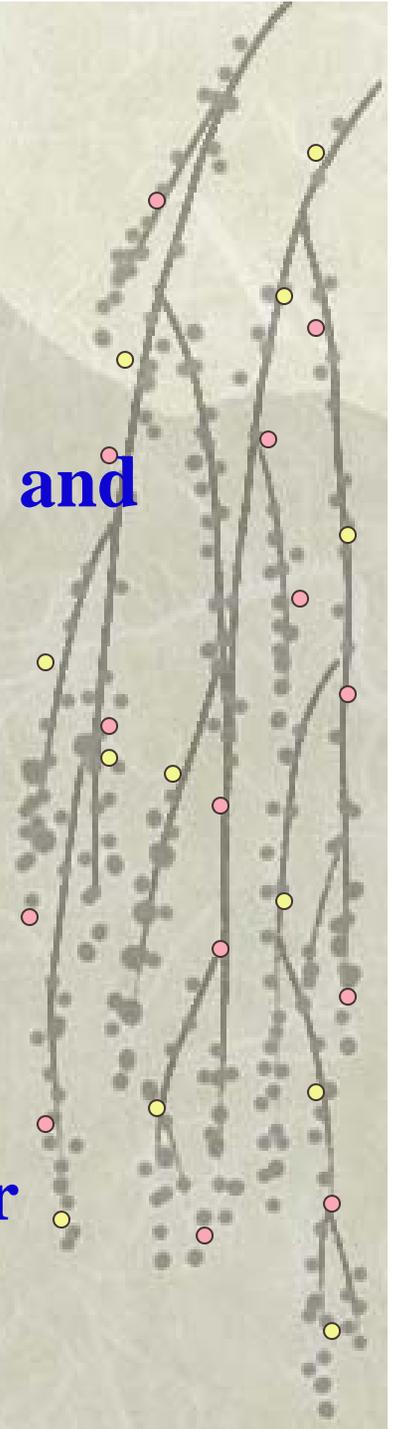

- Use headings to help readers find key sections.
- Balance the placement of text and graphics.
- Use white space creatively to grab viewers' attention.
- Follow the normal flow of reading: top to bottom and left to right.
- Use column format to make poster easier to read in a crowd.

General suggestions

Text and Font

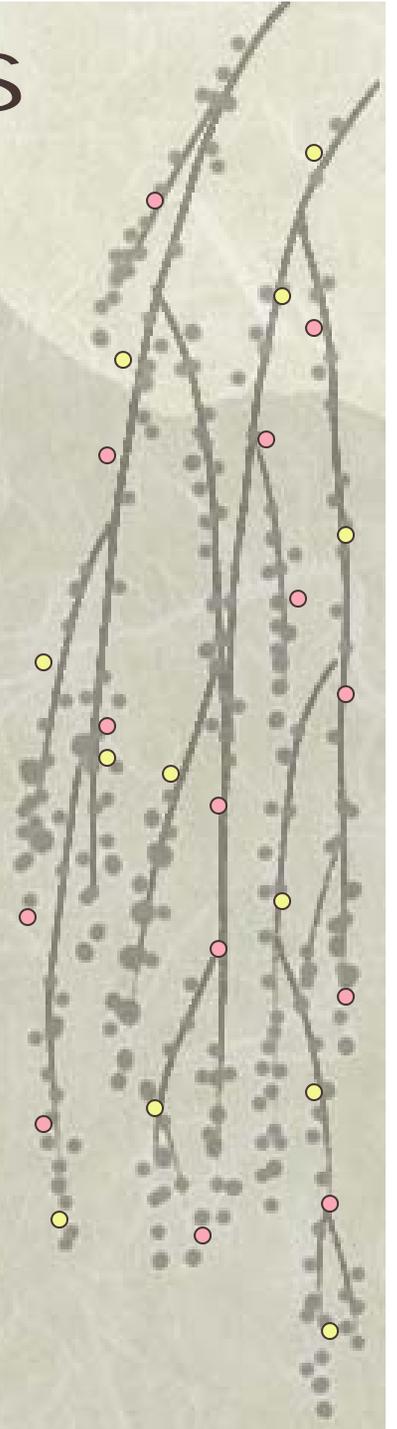

- Write simple, easily readable texts.
- Omit extraneous text by using key words and phrases.
- Highlight important words or phrases by switching styles: bold, underline, italic, shadow, etc.
- Do not use all capitals except in headings.
- Do not use too many different font types.
- Use large fonts: 18-point for the smallest text, 24-point for normal text, 28-point for heading, 48-point for title.

General suggestions

Photos, figures and tables

- Should be clear, self explanatory, uncomplicated, and of sufficient size.
- Tables and figures must have titles.
- Figures must include legends.
- Borders on photos and figures can enhance presentation

General suggestions

Color and contrast

- **Use color to draw attention to particularly important parts of your poster (but do not use everywhere)**
- **Use pleasing contrast to reduce eye strain and make the poster more legible and interesting**
- **Note that printed color may be different from what appear on the computer monitor**

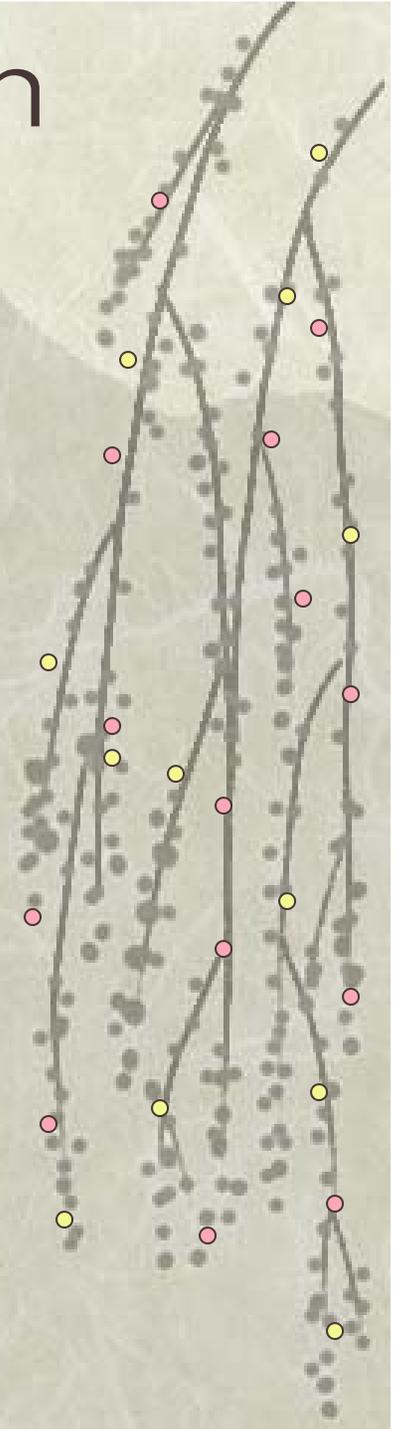

Additional information

Useful Website

<http://www.aspb.org/education/poster.cfm>

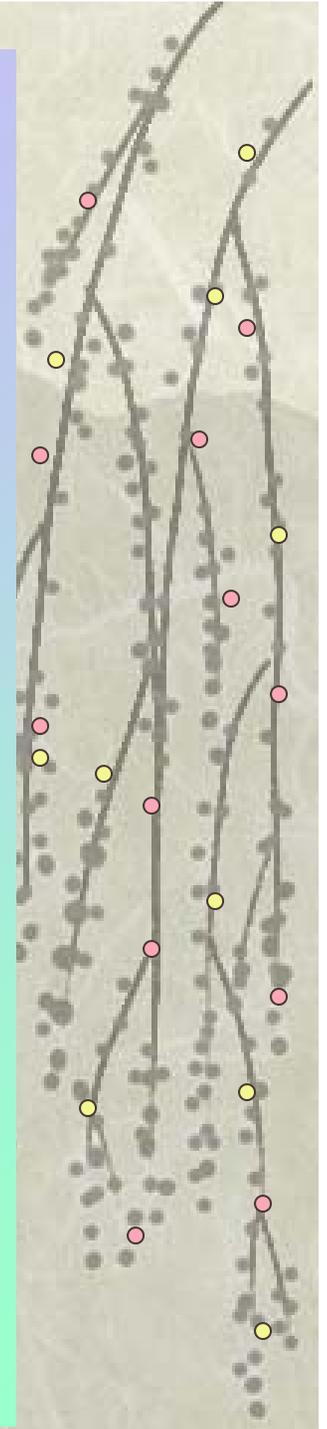

Software

MS Word, MS PowerPoint, Adobe Illustrator, LaTeX
InDesign

On Showcase Day

- **Be prepared to give a 2-minute presentation to judges**
- **Focus on the big picture, explain why the problem is important, and use the graphics to illustrate and support your key points.**
- **Limit jargon, judges may be from a mix of specialties in the discipline.**

On Showcase Day

- **Arrive early at the display site. Set up display before 1 pm.**
- **Bring the poster and all accessories.**
- **Bring copies of a handout (optional)**
- **Be there between 3 and 6:30 pm.**
